

## Use case Diagram

## Use cases (brief)

1. The Railway Network System wants to load the records from the .csv file. The system reads the .csv file and creates an array of Collection objects. The system returns that array and displays it as a visual list to the user.
2. The user wants to search for connections, so the user inputs the searching criteria that they are looking for. The system compares the searching criteria with each Collection object for matches. The system displays all Collection objects with all matching criteria.
